 The Python Mega Course: Build 10 Real World Applications

List Indexing (Practice)

Complete the `print()` function to print the 18th item from `mylist` using list indexing.

[View Solution](#)

exercise.py

```
1 mylist = ['a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k',  
           'l', 'm', 'n', 'o', 'p', 'q', 'r', 's', 't', 'u', 'v', 'w',  
           'x', 'y', 'z']  
2 print(mylist[17])
```

Line 2, Column 16 All changes saved

Reset code

✓ Well done, your solution is correct!

Report – Report can be typed or hand written for up to two pages.

Application 11: Project Exercise on Building a Geocoder Web Service:

- ◆ This one is built using scartch
- ◆ This will serve you two things.
- ◆ One is that you'll actually do something independently and you'll learn a lot from it.
- ◆ And the second one is you can use this as a portfolio.
- ◆ Step 1: Make the user interface.
- ◆ Step 2: Build a script that reads csv files and generates as output.
- ◆ And then make the flask structure and so on and then you go and implement these things.
- ◆ This is a flask application that expects from the user a csv file which should have at least a column named address.
- ◆ User can approach such file using the choose file button in here and you can also see that the chosen file is uploaded.
- ◆ If you press submit then the table shows up.
- ◆ That file is read using backend python and longitude and latitude is added using geocoding.

Certificate of Completion :
